

CLAIMS

We claim:

- 1 1. A system for removing organic or organometallic materials from an article
2 comprising:
3 an enclosed vacuum reaction chamber constructed and arranged to contain an
4 article having organic or organometallic materials located therein;
5 said enclosed vacuum reaction chamber containing an oxygen-containing gas,
6 wherein the vacuum pressure within said enclosed vacuum reaction chamber is between
7 about 50 mtorr and about 1500 mtorr;
8 means for emitting vacuum ultraviolet rays having a wavelength of about 172 nm
9 contained within said enclosed vacuum reaction chamber;
10 wherein said emitted vacuum ultraviolet rays fragment the hydrocarbon bonds in
11 said organic or organometallic materials;
12 wherein said oxygen-containing gas within said enclosed vacuum reaction
13 chamber and said emitted vacuum ultraviolet rays photochemically react to produce
14 ozone and activated oxygen; and
15 wherein said ozone and said activated oxygen react with said fragments of said
16 organic and organometallic materials.
- 1 2. The system as defined in Claim 1, wherein said means for emitting
2 vacuum ultraviolet rays is one or more dielectric barrier discharge lamps.
- 1 3. The system as defined in Claim 2, wherein said one or more dielectric
2 barrier discharge lamps contain xenon gas in an excimer state.

1 4. A system for removing organic and organometallic materials from an article
2 comprising:

3 a vacuum reaction chamber in which the vacuum pressure is from about 50 mtorr
4 to 1500 mtorr, said vacuum reaction chamber containing oxygen-containing gas and at
5 least one article having organic or organometallic materials located thereon;

6 means for emitting vacuum ultraviolet rays having a wavelength of about 172 nm
7 contained within said vacuum reaction chamber;

8 whereby when said vacuum ultraviolet rays are emitted within said vacuum
9 reaction chamber the hydrogen bonds in said organic or organometallic materials are
10 fragmented and oxygen-containing gas is broken down to produce ozone and activated
11 oxygen; and

12 said ozone and said activated oxygen combine with said fragmented portions of
13 said organic and organometallic materials.

1 5. The system as defined in Claim 4, wherein said means for emitting
2 vacuum ultraviolet rays is one or more dielectric barrier discharge lamps.

1 6. The system as defined in Claim 5, wherein said one or more dielectric
2 barrier discharge lamps contain xenon gas in an excimer state.

1 7. A method for removing organic or organometallic materials from an
2 article, said method comprising the steps of:
3 creating a vacuum of about 50 mtorr to about 1500 mtorr in an oxygen-containing
4 gas in a chamber;
5 placing an article containing organic or organometallic materials in said
6 oxygen-containing gas within said chamber;
7 irradiating said organic or organometallic materials with vacuum ultraviolet rays
8 having a wavelength of about 172 nm to induce an intermolecular molecule energy
9 transfer to said organic or organometallic material, whereby said intermolecular molecule
10 energy transfer results in a cleaving of at least one of the hydrogen bonds within said
11 organic or organometallic material;
12 irradiating said oxygen-containing gas to create ozone and activated oxygen; and
13 allowing said ozone and said activated oxygen to combine with said cleaved
14 portions of said organic or organometallic material.

1 8. The method as defined in Claim 7, wherein said ozone and said activated
2 oxygen are produced by a photochemical reaction.

1 9. The method as defined in Claim 7, wherein one or more dielectric barrier
2 discharge lamps are used to produce said vacuum ultraviolet rays.

1 10. The method as defined in Claim 9, wherein said one or more dielectric
2 barrier discharge lamps encapsulate xenon gas in an excimer state.

1 11. An article from which organic or organometallic materials have been
2 removed, said article being produced by a process including the steps of:

3 a) creating a vacuum of about 50 mtorr to about 1500 mtorr in a chamber
4 containing an oxygen-containing gas;

5 b) placing an article including the organic or organometallic materials in said
6 chamber;

7 c) irradiating said organic or organometallic materials and said
8 oxygen-containing gas within said chamber with vacuum ultraviolet light rays having a
9 wavelength of about 172 nm; and

10 d) removing said organic or organometallic materials from said article
11 utilizing the ozone and activated oxygen produced in step c).

1 12. The article as defined in Claim 11, wherein said ozone and said activated
2 oxygen are produced by a photochemical reaction.

1 13. The article as defined in Claim 11 wherein said step for irradiating said
2 oxygen-containing gas utilizes at least one dielectric barrier discharge lamp.

1 14. The article as defined in Claim 13 wherein said one or more dielectric
2 barrier discharge lamps contain xenon gas in an excimer state.

1 15. A system for removing the organic or organometallic material from an
2 article in a dry environment, said system comprising:

3 an enclosed vacuum reaction chamber constructed and arranged to contain an
4 article having organic or organometallic material on its surface and on its sidewalls;

5 said enclosed vacuum reaction chamber containing an oxygen-containing gas
6 wherein the vacuum pressure is between about 50 mtorr and about 1500 mtorr;

7 an irradiation device for emitting vacuum ultraviolet rays having a wavelength of
8 about 172 nm contained within said enclosed vacuum reaction chamber to induce an
9 intermolecular molecule energy transfer to said organic or organometallic material and to
10 create ozone and activated oxygen from said oxygen-containing gas; and

11 wherein said ozone and said activated oxygen removes said organic or
12 organometallic material from said surface and said sidewalls of said article.

1 16. The system as defined in Claim 15 wherein said irradiation device is one
2 or more dielectric barrier discharge lamps;

1 17. The system as defined in Claim 16 wherein said one or more dielectric
2 barrier discharge lamps contains xenon gas in an excimer state.

9

1 18. A method for removing the sidewall polymer and photoresist from an
2 article, said method comprising the steps of:

3 creating a vacuum of about 50 mtorr to about 1500 mtorr in a vacuum reaction
4 chamber;

5 placing an article having sidewall polymer and photoresist in said vacuum
6 reaction chamber;

7 irradiating said vacuum reaction chamber with vacuum ultraviolet light rays
8 having a wavelength of about 172 nm to produce ozone and activated oxygen for
9 removing said polymer and photoresist from said article.

1 19. The method as defined in Claim 18 wherein step for irradiating said
2 vacuum reaction chamber is performed by at least one dielectric barrier discharge lamp.

1 20. The method as defined in Claim 19 wherein said dielectric barrier
2 discharge lamp includes a xenon gas in an excimer state.

1 21. An apparatus for dissociating molecular bonds in a vacuum comprising:
2 a dielectric barrier discharge lamp capable of withstanding pressures between
3 about 50 mtorr and 1500 mtorr.

1 22. An apparatus according to Claim 21 wherein said dielectric barrier
2 discharge lamp includes a xenon gas in an excimer state.

1 23. An apparatus according to Claim 21 wherein said dielectric barrier
2 discharge lamp emits wavelengths at approximately 172 nm.
